

Self-operated Pressure Regulators

Type 41-73 Universal Excess Pressure Valve

ANSI version

Application

Pressure regulator for set points from **0.75 to 400 psi (0.05 to 28 bar)** · Valves in **NPS ½ to 4 (DN 15 to 100)** · Pressure rating **Class 125 to 300 (PN 16 to 40)** · Suitable for water, gases and vapors up to **660 °F (350 °C)**

The valve **opens** when the upstream pressure **rises**.

Special features

- Low-maintenance proportional regulators requiring no auxiliary energy
- Frictionless plug stem seal with stainless steel bellows
- Control line kit for tapping the pressure directly at the valve body (accessories)
- Wide set point range and convenient set point adjustment using a nut
- Exchangeable actuator and set point springs
- Spring-loaded, single-seated valve with upstream and downstream pressure balancing ¹⁾ by a stainless steel bellows
- Plug with soft sealing for better shut-off performance
- Low-noise standard plug · Special version with flow divider St I for further noise level reduction (see Data Sheet ▶ T 8081)
- All wetted parts are free of non-ferrous metal

Versions

Excess pressure valve to control the upstream pressure p_1 to the adjusted set point. The valve opens when the upstream pressure rises.

Type 41-73 · Standard version

Type 2417 Valve · Valve in **NPS ½ to 4 (DN 15 to 100)**
Metal-seated plug · Body made of either cast iron A126B, cast steel A216 WCC or cast stainless steel A351 CF8M

Type 2413 Actuator with EPDM rolling diaphragm

Extended versions

Excess pressure valve with increased safety

Actuator with leakage line connection and seal or two diaphragms and diaphragm rupture indicator · Valve with back-up packing

Special versions

- Control line kit for tapping the pressure directly at the valve body (accessories)
- Internal parts made of FPM (FKM), e.g. for use with mineral oils

¹⁾ With $C_v \leq 5/K_{VS} \leq 4$: without balancing bellows

Fig. 1: Type 41-73 Universal Excess Pressure Valve

- EPDM diaphragm with PTFE protective foil
- Actuator for remote set point adjustment (autoclave control)
- Bellows actuator for valves NPS ½ to 4 (DN 15 to 100)
Set point ranges 30 to 85 psi, 75 to 145 psi, 145 to 320 psi, 300 to 400 psi (2 to 6 bar, 5 to 10 bar, 10 to 22 bar, 20 to 28 bar)
- Valve with flow divider St I for particularly low-noise operation with gases and vapors
- Version entirely of stainless steel
- Stainless Cr steel seat and plug with PTFE soft seal (max. 440 °F/220 °C) · With EPDM soft seal (max. 300 °F/150 °C)
- Version for industrial gases
- Free of oil and grease for high-purity applications
- Stellite seat and plug for low-wear operation
- Wetted plastic parts conforming to FDA regulations (max. 140 °F/60 °C)

Principle of operation (Fig. 2)

The medium flows through the valve (1) as indicated by the arrow. The position of the plug (3) determines the flow rate across the area released between plug and valve seat (2). The plug stem (5) with the plug is connected to the stem (11) of the actuator (10).

To control the pressure, the operating diaphragm (12) is tensioned by the set point springs (7) and the set point adjuster (6) so that the valve is closed by the force of the set point springs when it is relieved of pressure ($p_1 = p_2$).

The upstream pressure p_1 to be controlled is tapped upstream of the valve and transmitted over the control line (14) to the operating diaphragm (12) where it is converted into a posi-

tioning force. This force is used to move the valve plug (3) according to the force of the set point springs (7).

The spring force is adjustable at the set point adjuster (6).

When the force resulting from the upstream pressure p_1 rises above the adjusted set point, the valve opens proportionally to the change in pressure.

The fully balanced valve has a balancing bellows (4). The downstream pressure p_2 acts on the inside of the bellows, whereas the upstream pressure p_1 acts on the outside of the bellows. As a result, the forces produced by the upstream and downstream pressures acting on the plug are balanced out.

The valves can be supplied with flow divider St I. The valve seat must be replaced on retrofitting the flow divider St I.

Installation

Normally, the valve is installed with the actuator suspended downwards. Install pipelines horizontally with a slight downward slope on both sides of the valve for drainage of the condensate.

For further details on installation, see ► EB 2517.

The direction of flow must correspond with the arrow on the valve body.

- The control line must be adapted to match the onsite conditions and is not delivered with the valve. On customer request, a control line kit for pressure tapping directly at the valve body (see accessories) is available.

Type 41-73
Standard version

- Control line kit - optionally with or without compensation chamber - for direct attachment to the valve and actuator (pressure tapped directly at the valve body, for set points ≥ 12 psi (≥ 0.8 bar).
- Compensation chamber for steam condensation and protection of the operating diaphragm against extreme temperatures. This chamber is necessary for steam and liquids above 300 °F (150 °C).

Type 41-73
Control line connection and compensation chamber

Detailed information on accessories can be found in Data Sheet ► T 2595.

1) For $C_V \leq 5/K_{VS} \leq 4$: without balancing bellows

2) Max. permissible differential pressure 363 psi (25 bar)

Valve-specific correction terms

ΔL_G · For gases and vapors:

Values as specified in the diagram

Fig. 5: Diagram - ΔL_G for gases and vapors -

ΔL_f · For liquids:

$$\Delta L_f = -10 \cdot (x_f - x_{fZ}) \cdot y$$

with $x_f = \frac{\Delta p}{p_1 - p_v}$ and $y = \frac{K_v}{K_{VS}}$

Terms for control valve sizing according to IEC 60534, Parts 2-1 and 2-2:

$$F_L = 0.95$$

$$X_T = 0.75$$

x_{FZ} · Acoustical valve coefficient

$C_V I, K_{VS} I$ · When a flow divider St I is installed as a noise-reducing component · Flow characteristic differences between valves with and valves without flow dividers do not occur until the valve has passed through approx. 80 % of its travel range.
